122) The accountant for a large U.S. company is interested in finding the probability that an account will have an incorrect balance due to being overstated or being understated. To find this probability, which probability rule is she likely to use?
Answer: The key word here is or, which, in dealing with probability, always means addition. Thus, the addition rule will need to be used.
Diff: 2
Keywords: probability, addition rule
Section: 4-2 True Rules of Probability
Outcome: 2
123) Assume that a standard deck of 52 playing cards is randomly shuffled and the first 2 cards are dealt to you. What is the probability that you have a blackjack? A blackjack is where one card is an ace and the other card is worth 10 points. The 10-point cards are kings, queens, jacks and 10’s.

Answer: It doesn’t matter which card was first so there are two ways to have a blackjack. One is to get the ace first and the 10-point card second. The other way is to get the cards in the reverse order. There are 4 aces and 16 of the 10-point cards.

\[ P(\text{Ace on 1st card}) = \frac{4}{52} \]
\[ P(10 \text{ on 2nd card given that 1st card was Ace}) = \frac{16}{51} \]

So \( P(\text{black where Ace is 1st}) = (\frac{4}{52})(\frac{16}{51}) = 0.0241 \)

\[ P(\text{Ace on 1st card}) = \frac{16}{52} \]
\[ P(\text{Ace on 2nd card given the first card was a 10}) = \frac{4}{51} \]

So \( P(\text{blackjack where Ace is 2nd}) = (\frac{16}{52})(\frac{4}{51}) = 0.0241 \)

The two methods of getting a blackjack are mutually exclusive so these probabilities can be added to find the total probability of a blackjack.

\[ P(\text{blackjack}) = 2 \times (0.0241) = 0.0482 \]

Diff: 2

124) Explain what is meant by the term *mutually exclusive events*. Cite an example.

Answer: Mutually exclusive events exist if the occurrence of one event precludes the occurrence of another event. For example, if a customer is selected at random for a store’s master file, if the customer is a female, the same customer cannot also be a male. Thus the events female and male are mutually exclusive.

Diff: 1
Keywords: mutually exclusive, event
Section: 4-2 True Rules of Probability
Outcome: 2

125) Explain why it is possible for two managers to assess different values for the probability that a supplier will fail to deliver a shipment on time.

Answer: Since it is likely that the managers are using subjective probability assessment, their assessments reflect their state of mind about the shipment. They are basing this on any information that they have and their methods of processing the information may be different. Neither assessment can be considered wrong—they simply reflect the thinking of each decision maker. All that is required is that the decision makers process the information in a rational manner.
